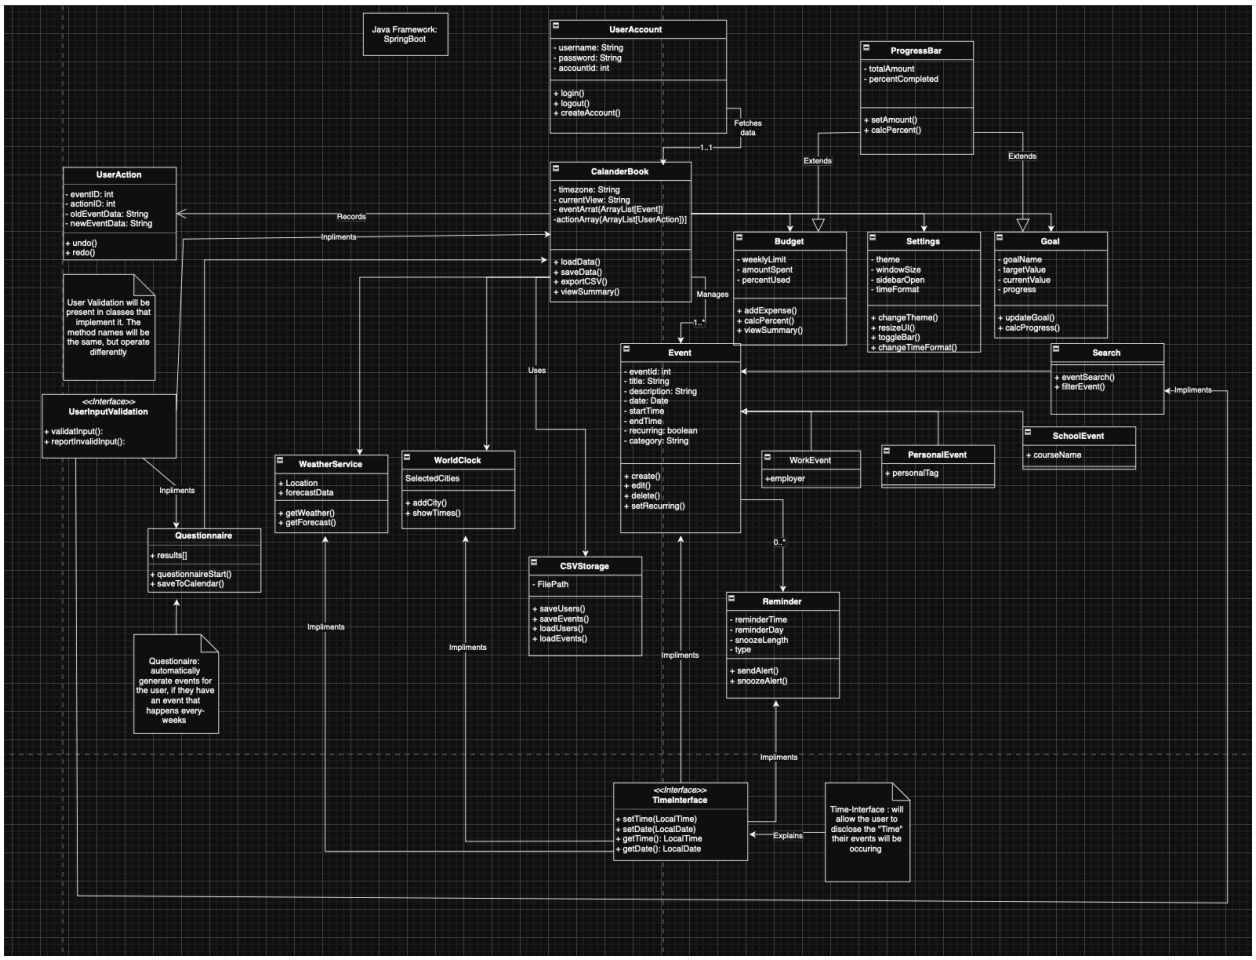
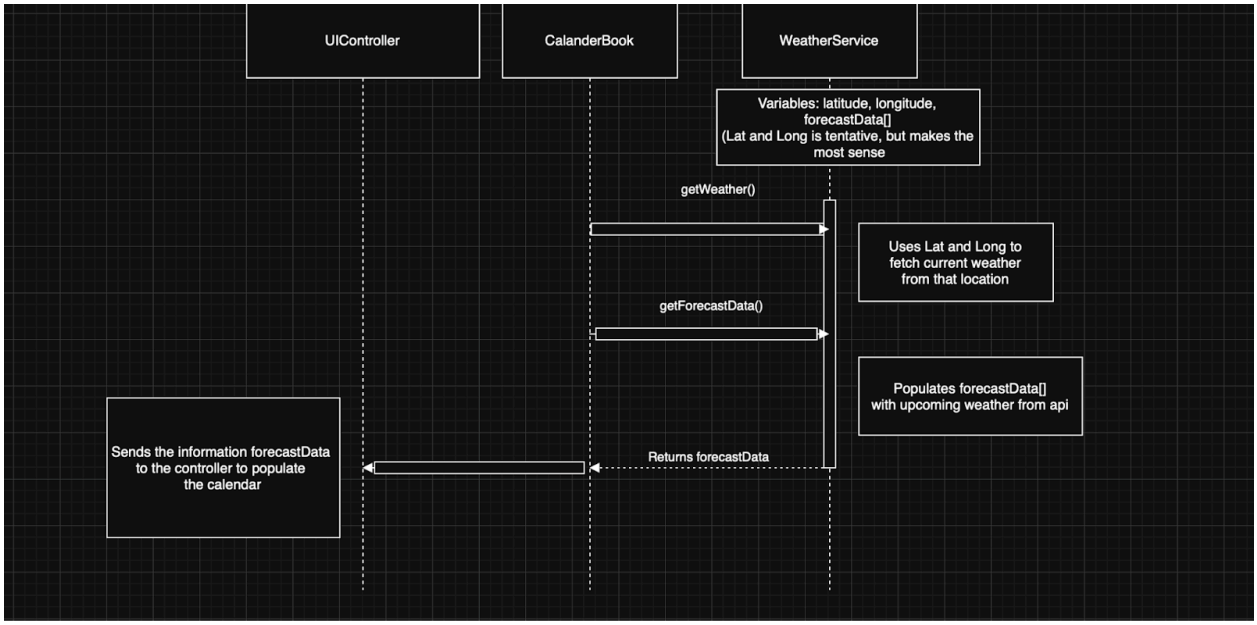
Class Diagram



WeatherService Class

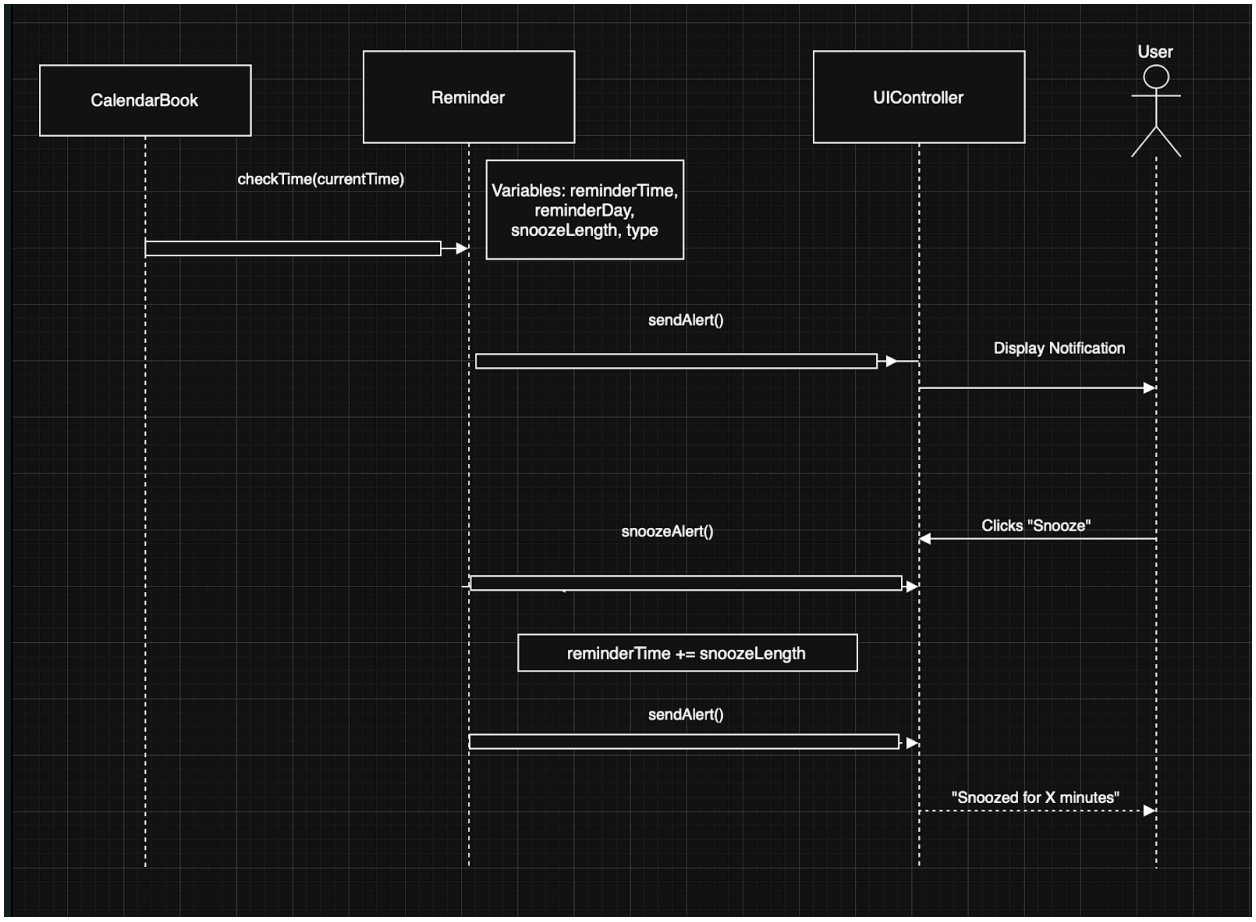
The WeatherService class will handle the API calls for getting the weather data. It will hold the location data and the forecast data. There will be a getWeather() function to get the current weather. There will also be a getForecast() function which will get the data for the weather forecast for the next seven days.



Reminder Class

The Reminder class will handle sending notifications such as reminders of upcoming events and will also be able to be snoozed or be reoccurring. The reminderTime variable will hold the schedule time for the reminder and the reminderDay will hold the date. The type variable will hold what kind of event it is and the snoozeLength will hold how long before the

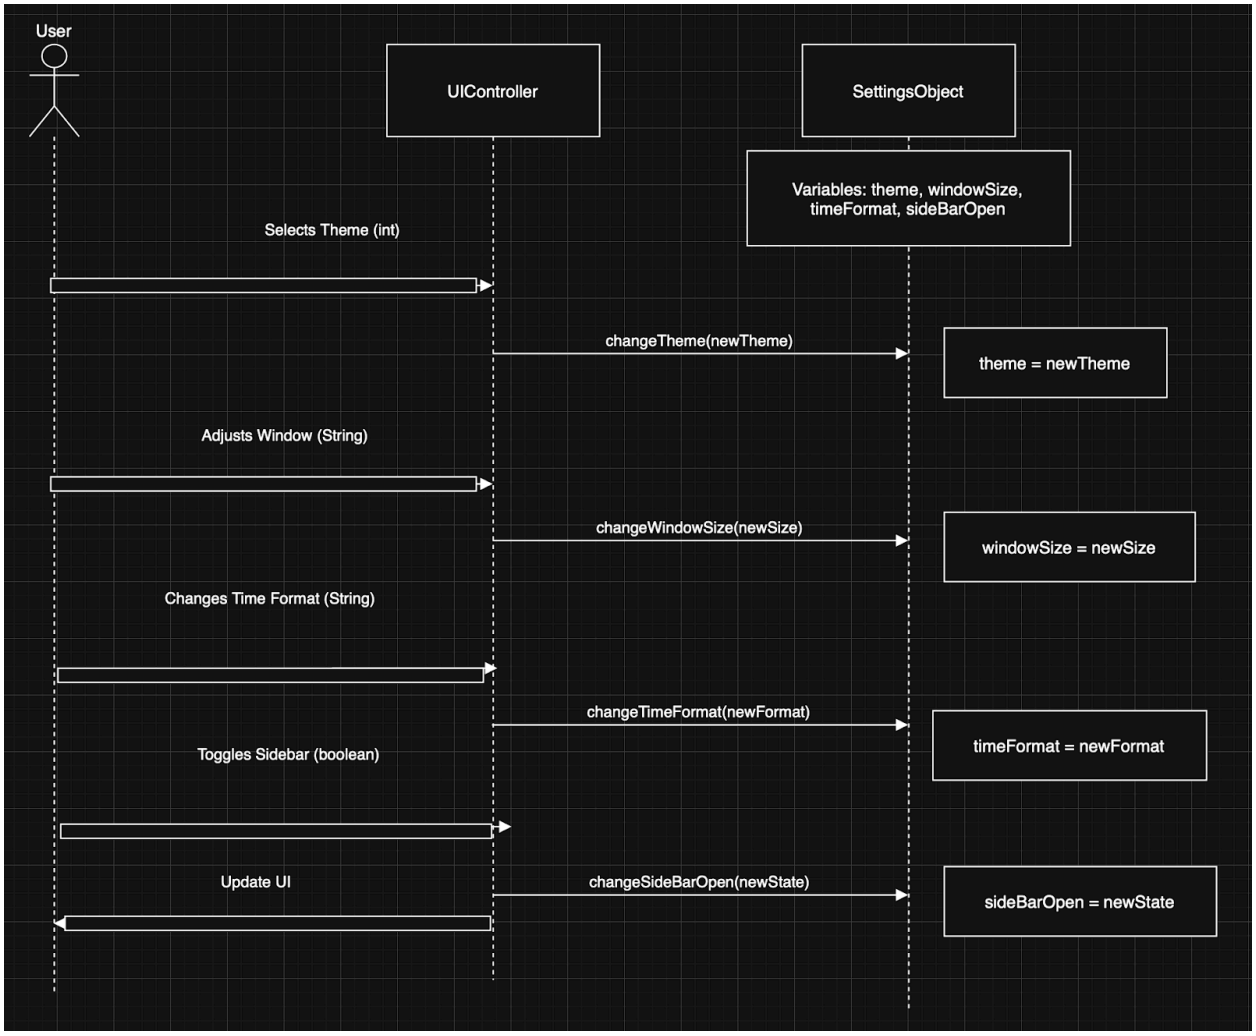
reminder sends another alert. The sendAlert() function will send a notification to remind the user about the event. The snooze() function will silence it and snooze.



Settings Class

The settings class will handle much of the customizability of the calendar. It will hold the theme, windowSize, sideBarOpen, and timeFormat variables. The theme will be the color of the calendar and the windowSize will be how large the application is on the user's screen. There will also be a variable timeFormat holding the current time format. The changeTheme() function will be used to change the theme of the application and the resizeUI() will be used to change the window size. The toggleSideBar() function will open or close the sidebar acting like an on/off

button. The changeTimeFormat() function will be used to change the time format between dd/mm/yy and mm/dd/yy formats.



CalendarBook Class

Stores Events, UserActions, and ProgressBars in program memory. Handles saving and loading events and progress bars. Allows for Events, ProgressBars, and undo/redo functionality to be accessed.

Event

Template for storing data for a calendar event. Generic superclass for more specific event types.

TimeTracking

Interface for handling date and time information for objects which either keep track of the current date/time or have a date/time associated with them.

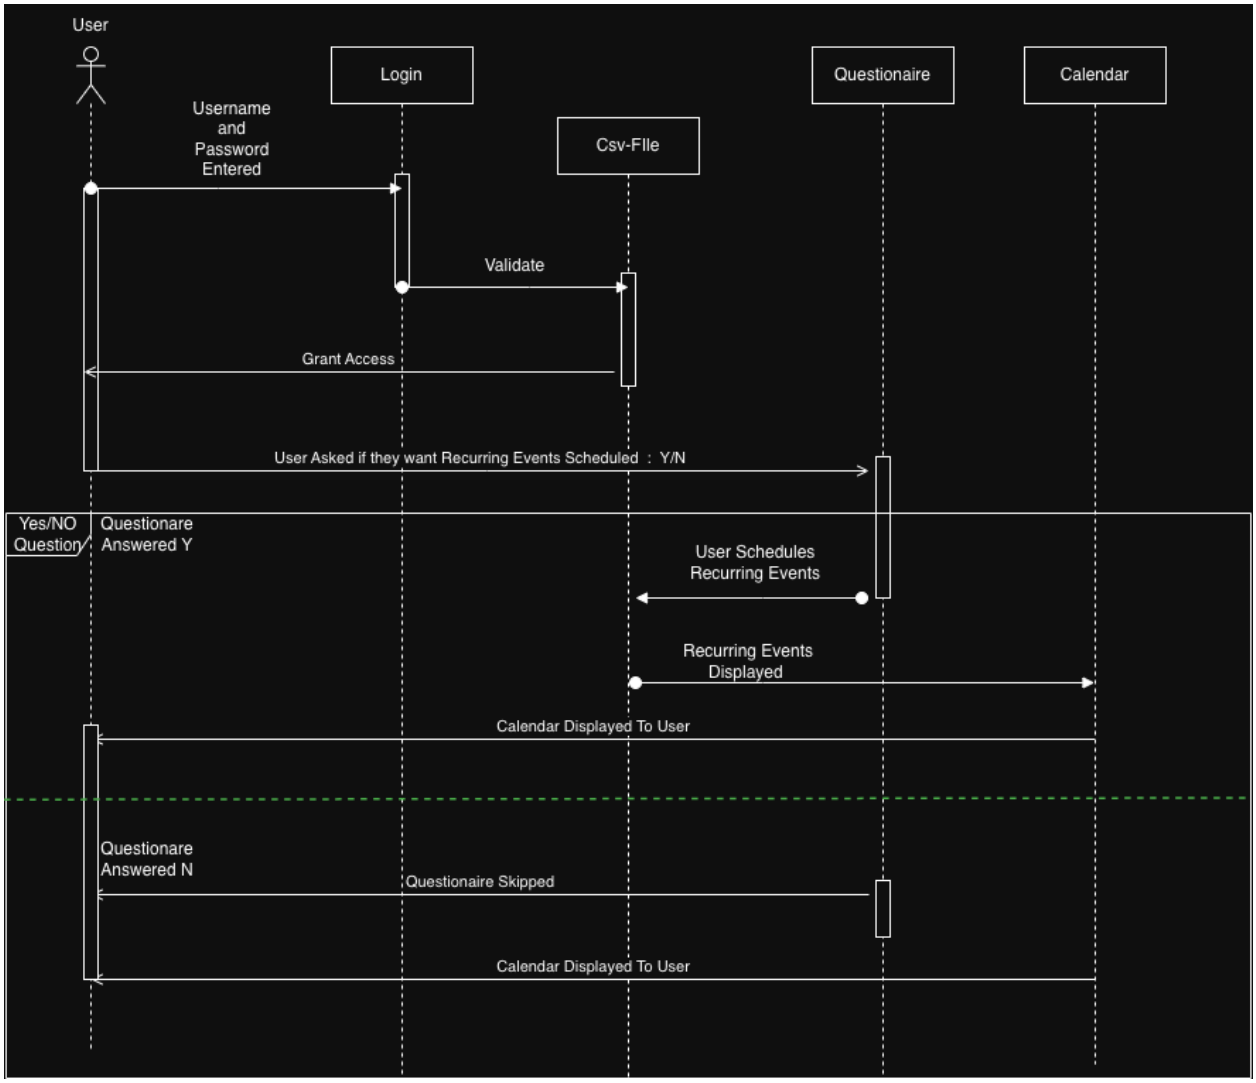
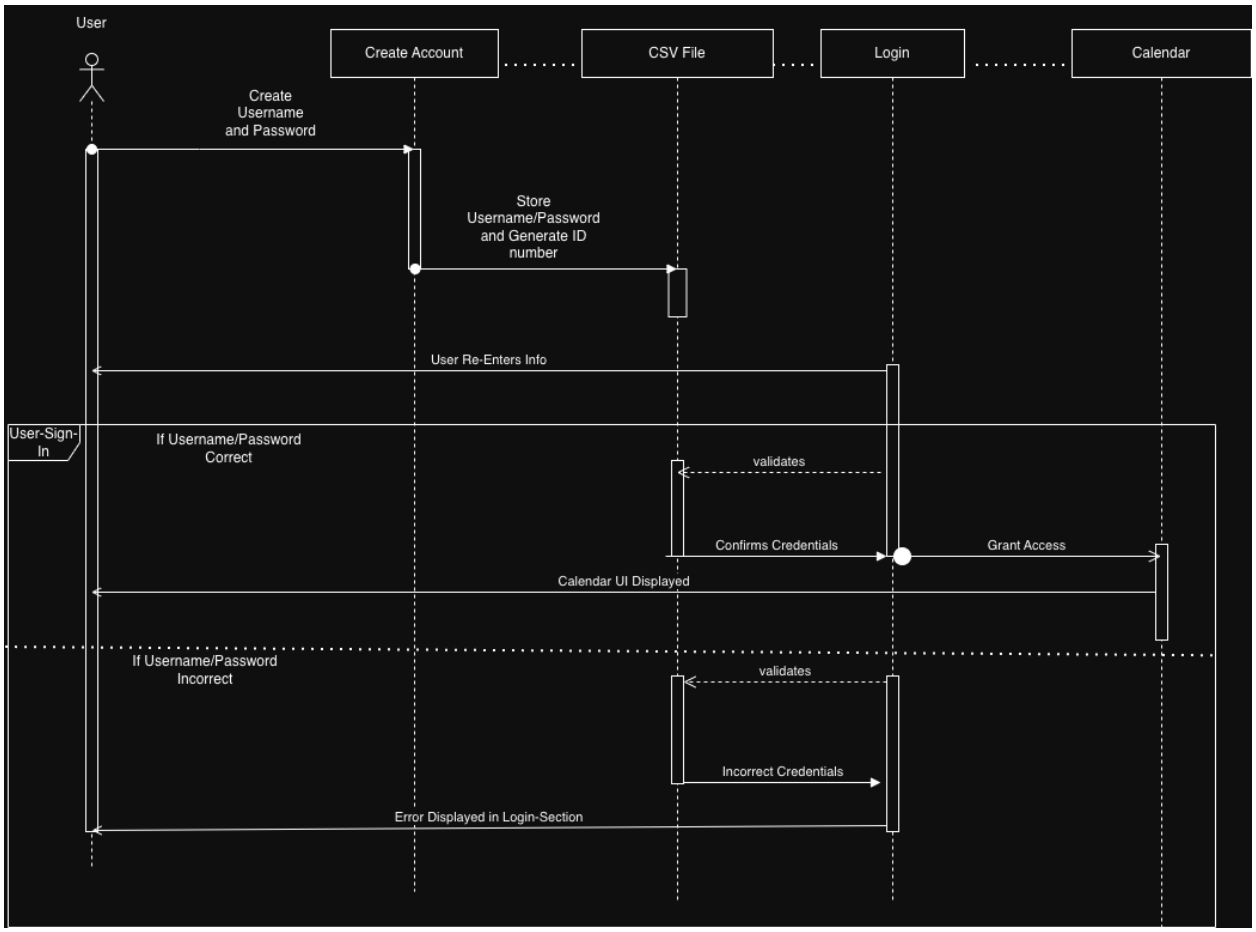
Questionnaire Class

Serves as an easy method for the users to implement recurring events to their calendar, before accessing their CalendarBook. They will be prompted on the "Date" , and "Time" of the recurring event. Recurring events occur "each week, on the same day and time".
Recurring events can be stacked on the same day and time, but the limit will be two a day and if the user attempts to add more, a prompt will appear " Only Two Events A Day". The questionnaire can be skipped, but adding "recurring events" will not be restricted. The option will show when the user attempts to create a new event within their CalendarBook.

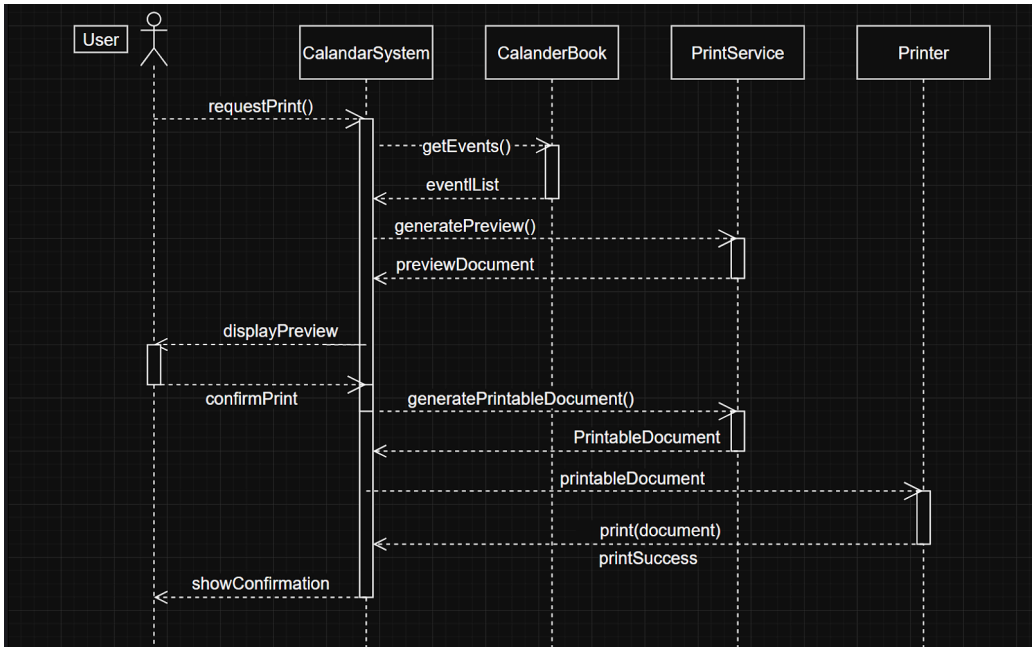


User Class

Will hold users' "Username ,Passwords and UserIDs". When a user creates a username and password, it will be stored in a CSV- file and an ID number will be generated randomly for the user to link to their account and CalendarBook. If a user's username or password is incorrect, the login screen will display a prompt that says - "Username or Password is Incorrect. Try Again".



Print Class



User
CalandarSystem
CalanderBook
